Wild Native Flowering Plants of Western North Carolina

CULTURE

Rhododendrons, Azaleas, Leucothoe, Kalmia, and many other plants and bulbs are acid soil loving. They should never be given lime in any form. The soil should be rich with decayed vegetable matter such as leaf mold, decayed manure, etc. A mixture of oak leaves and other acid forming material is good. The soil should be deep and porous. Rhododendrons need plenty of moisture yet well drained soil. If the soil is too heavy as in clay soil, lighten with sand and material as above mentioned. Never allow your plants to suffer for water. On receiving them, soak well in water before planting and keep WELL WATERED. We will be glad to answer all questions as to any plant or plants we have which will enable your successful planting and cultivation.
